

## QATERIE TAILORED MENÚ FORM

This documentation contains basic instructions about the implementation of the pastries multi step form for Qaterie.

### For designers

- All elements can be customized as much as needed, it won't affect the script functionality.

**Note:** customizing means styling the CSS properties in Webflow's Designer:

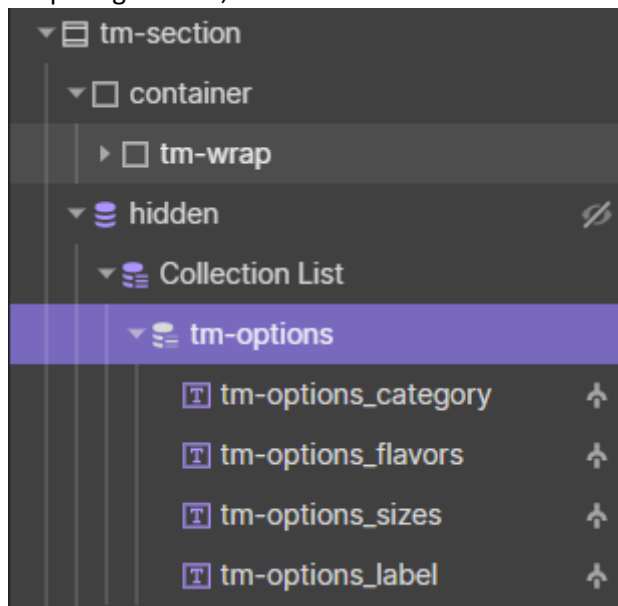

- All elements have classes applied to them, named with a “tm-” prefix to avoid class name collisions. Class names can be changed on all elements except the ones mentioned in the next bullet.
- All elements can be moved around **except** the following ones:
  - o All elements inside the “tm-pastry” block.
  - o All elements inside the “tm-confirm-pastries” block.

These ones should not be moved or deleted as the script generates them dynamically.

**Note:** they can be styled with no problems as the rest of the elements, as long as the class names aren't changed.

## For developers

- GitHub repository: <https://github.com/brotame/gaterie>
- Code is written in Vanilla Javascript.
- As the code uses ES6 modules, it needs to be bundled. ParcelJS is used as a dependency to bundle and compile (ParcelJS uses Babel).
- There are 4 modules:
  - o Msf.js: controls the multi step functionality of the form.
  - o Pastry.js: controls the pastries functionality (collecting data, adding, removing, toggling, printing).
  - o Base.js: Contains the nodes that the code affects to and gets the available options of the pastries (read below).
  - o Index.js: General controller.
- Pastry options are set through Webflow's CMS. In order to make them available for the script to get them, a hidden collection is set on the page that prints out the values.

## For the client

- Pastry options can be created, edited or removed through Webflow's CMS.
- The collection that contains all the options is the one called "TM Options".

CMS Collections × 	TM Options ×
 TM Options 3 items >	Name
 Vacancies 4 items	Tarts
 Creations Categories 6 items	Pâte à choux
 Creations 9 items	Cake

- Each collection item represents a Category. Inside the item, there are the following fields:
  - o Name: Category Name
  - o Slug: It's not used, so no need to bother about it.
  - o Flavors: Flavor options, separated with a comma and space ", ".
  - o Sizes: Size options, separated with a comma and space ", ".
  - o Quantity Label.

 Pâte à choux
